

## ABSTRACT OF THE DISCLOSURE

In accordance with an embodiment of the present invention, a computer system may include a sensor to measure the approximate distance between the user and the system. Based on this distance, one or more I/O devices of the computer system may be appropriately configured. For example, for one embodiment the image on a display screen of the computer system may be modified to enhance visibility. For another embodiment, the gain or volume of an audio device may be modified to enhance audibility.
